Monday, March 10, 2013 In a world where access to information is the key to successfully navigating it, the acquisition of a multilingual dictionary is an important investment. Some may argue it is also a necessity. The first stage of language learning involves memorizing vocabulary and the initial acquisition of fluency can be thought of as access to knowledge. Obviously, vocabulary is a key element in the acquisition of a language, and without a dictionary, new words are lost. As a result, dictionaries have been an integral part of language programs, with translated versions available for a multiplicity of languages. As a result, dictionaries are a reflection of the world around us and in the Internet's infancy, access to information was key to the development of technology, as was the advent of computers. As a result, dictionaries provided users with a means to accomplish a myriad of tasks. Basically, dictionaries allow their users to look up words and phrases in their target language, and then use translations to further their understanding. If access to information is the key to success, then the capacity to find it quickly is an essential quality of a dictionary. This is best illustrated in the case of users seeking information about a specific subject. For example, if the user wishes to identify the origins of the word "bravo," they can choose to look up the word in a dictionary and then use the information to look up the word in a specialized dictionary or encyclopedia. However, the user can also employ a search engine and look for the word. If a database is less than comprehensive, they could consider combing the results with that of a multilingual dictionary and after sorting the data they may encounter information pertaining to the origin of the word. If the user is proficient in another language and has access to a bilingual dictionary, the search can be further narrowed by using a combined source, whereby a specific word is searched in their
